Q1. For the set of three charges shown below, $\mathrm{q}=10 \mu \mathrm{C}$ and $\mathrm{R}=0.3 \mathrm{~m}$, find:
a) The electric field at the center ( O ).
b) The electric potential at the center (O).

Q2. In the figure shown below, two point charges, $Q_{1}=+6.0 \mathrm{nc}$ and $\mathrm{Q}_{2}=-4.0 \mathrm{nc}$, are separated by 30.0 cm .
a) What is the potential energy of the pair?
b) What is the electric potential difference $\mathrm{V}_{\mathrm{ab}}$ ?

Q3. A point charge $\mathrm{q}=+9 \mu \mathrm{c}$ is located 4 m from an infinite line of uniform charge per unit length $\lambda=-7 \mu \mathrm{c} / \mathrm{m}$. Find:
a) The electric field at point "p".
b) The electric force on charge q.

Q4. In the figure shown below, if the magnitude of $\vec{E}$ is $2 \times 10^{4} \mathrm{~N} / \mathrm{C}$ and the cube has a side of $\mathrm{a}=0.1 \mathrm{~m}$, in each of the following cases determine the electric flux through the shaded face of the cube.

( $\vec{E}$ is to the right) ( $\vec{E}$ is upwards) ( $\vec{E}$ at an angle of $\left.37^{\circ}\right)$
Q5. A spherical conductor has a radius of 12 cm and charge of 30 nc .
Calculate :
a) The electric field at center "O" and at point "p" 20 cm from " $O$ ".
b) The potential difference $V_{o p}$.

Q6. An air-filled capacitor consists of two parallel plates, each with an area of $7.5 \mathrm{~cm}^{2}$, separated by a distance of 1.6 mm . The capacitor is charged to a potential difference of 100 volt, then is removed from the source.
a) Calculate the electric field between the plates.
b) If the plates were pulled apart such that their separation becomes 3.2 mm , what would be the voltage across the plates?
c) The space between the plates of capacitor (in part a) is filled with a dielectric substance of dielectric constant $\mathrm{K}=2.5$. What is the voltage across the plates?

Q7. In the circuit shown, find:
a) The currents in $\mathrm{R}_{1}, \mathrm{R}_{2}$ and $\mathrm{R}_{3}$.
b) The charge on capacitor C .

$$
\mathrm{R}_{1}=15 \mathrm{k} \Omega
$$

Q8. A copper wire of 2 m in length has a cross section area $2.5(\mathrm{~mm})^{2}$ carries a current of 5 A . The density of free electrons is $2.8 \times 10^{29} \mathrm{~m}^{-3}$. Compute:
a) The drift velocity of the electrons.
b) The potential drop along the wire. Use $\rho=1.72 \times 10^{-8} \Omega . \mathrm{m}$.

Q9. In the circuit shown, the current was found to vary according to the following relation where $I$ is in $\mu \mathrm{A}: I(t)=20 e^{-t / 10} \quad(\mu \mathrm{~A})$. If $\mathrm{C}=2 \mu \mathrm{~F}$, find:
a) The values of $\varepsilon$ and R
b) The charges that passes through the circuit during 20 s .

Q10. Two long, parallel wires carry currents $\mathrm{I}_{1}=3.0 \mathrm{~A}$ and $\mathrm{I}_{2}=3.0 \mathrm{~A}$, both directed into the figure given below. Determine the magnitude of the resultant magnetic field at point " $p$ ".

Q11. A wire (mass $=50 \mathrm{~g}$, length $=40 \mathrm{~cm}$ ) is suspended horizontally by two vertical wires which conduct a current $\mathrm{I}=8 \mathrm{~A}$ as shown in the figure below. The magnetic field in the region is into the paper and has a magnitude of 60 mT . What is the tension (in N ) in both wires?

Q12. An electron with kinetic energy $1.92 \times 10^{-16} \mathrm{j}$ circles in a plane perpendicular to a uniform magnetic field. The orbit radius is 25 cm . Find:
a) The magnetic field B .
b) The frequency of circling .

Q13. A portion of a complete electric circuit is shown in this diagram. The current in some resistors are given, current in others must be found. What is the potential difference between points (a) and (b).

Q14. A solenoid 3.55 cm in diameter and 1.23 m in length has 850 turns and carries a current of 4.6A. Find:
a) The magnetic field at its center.
b) The average magnetic flux through its cross section.

Q15. A rectangular conduction loop of area $\mathrm{A}=0.02 \mathrm{~m}^{2}$ and resistance $\mathrm{R}=0.1 \Omega$. A time varying magnetic field in a direction perpendicular to the plane of the loop is given by the equation:

$$
\begin{equation*}
B(t)=0.2 \cos (100 \pi t) \tag{T}
\end{equation*}
$$

Find:
a) The induced emf in the loop as a function of time.
b) The maximum value and direction of induced current in the loop.
